If you have questions or concerns about the SWAP report, raw water from Colorado’s source waters, however, a report from the State has not yet been completed for the Greeley Water Department.

The SWAP Program has completed its assessment of our semi-arid climate, conservation and storage are our best tools to meet our water needs for jobs and recreation and food.

We know dry periods are especially prone to forest fires, as shown by last year’s Lower North Fork and High Park fires. During drought, with forest fires threatening to contaminate our water supplies and not enough water to go around, additional water in storage could make the difference. We will be dealing with the ash and run off into our water supplies for years to come. More storage will provide backup to ensure a supply of safe, consistent drinking water.

We are not alone. Denver Water, Northern Water, and Fort Collins as well as Greeley, all have storage projects in the permitting process. If these projects were in operation, we would have been able to store much of the water that instead left the state.

Increased storage is one piece of the puzzle. Conservation is the other.

Greeley has had mandatory water restricting in place since 1997. Other cities are now imposing similar restrictions in response to the combination of drought and wildfires. We welcome those efforts to encourage conservation, which is a good idea whether we are in a wet or dry climate. Water is too precious to waste.

Jon Monson
Greeley Water & Sewer Director

Make the Most of Your Lawn Watering

It's important that we make every drop count on our landscapes. Here are some tips to help you get the most from your water.

1. Walk your entire system while its running, look for leaks and inspect each head ensuring they spray correctly. Adjust as needed making sure they clear the lawn and are not tilted. If they are, raise them to grade or straighten them. A great deal of water is wasted when heads are not at proper height, level or pointed in the correct direction.

2. Water between 1:00 am and 4:00 am. The air is coolest at this time limiting evaporation and there is less wind to disrupt the spray.

3. A cycle and soak watering schedule will reduce water running off onto the sidewalk. Here is an example, your lawn need an inch of water per week in May. The best option is to water in shorter cycles. Water each zone 7 minutes and wait 30 minutes to let it soak in. While waiting, water other areas of the lawn. Then water the first area again for 7-8 minutes. Always account for any rain that you receive.

4. Set your controller to water only one day in early spring, as the days get longer and hotter add a day until you have added all three. Do the opposite as we move closer to fall.

For example; water one day a week in April to mid May then two days a week into mid June and then increase three days. In August cut back to two days, in mid September drop back to one day until the watering season is over.

Follow these tips to help use only what your landscape needs, reducing overspray, overwatering and run off, making every drop count. Please visit www.greeleygov.com/water for more water conservation tips.

Protecting Water Sources

Source water is untreated raw water from streams, rivers, lakes, or underground aquifers which is used to supply public drinking water.

The Colorado Source Water Assessment and Protection (SWAP) program encourages community-based protection and preventative management strategies to ensure that all public drinking water resources are kept safe from future contamination.

The SWAP Program has completed its assessment of Colorado's source waters, however, a report from the State has not yet been completed for the Greeley Water Department. When Greeley’s SWAP Report is finalized, it will be available by calling the contact listed or accessing the SWAP website: www.colo.state.co.us/wq/sw/swapreports/swapreports.html. If you have questions or concerns about the SWAP report, please call John Daggaan, with the Colorado Department of Public Health and Environment, at 303-692-3534.

Green Things We’re Doing

Solar Panels: The Water Pollution Control Facility is home to the largest solar array in Weld County. Covering 3 acres, the 500-kilowatt installation has 2,016 solar panels that generates about 796,350 kilowatt-hours of electricity and reduces 745 tons of carbon dioxide in the first year. Solar power projects at the Boyd Lake and Bellvue Water Treatment Plants are in development.

Savings Water: In 2007, Greeley installed low-flow toilets at City Hall and the City Hall annex buildings. This has saved about 2 million gallons of water since then. More projects are planned, like new toilets at the Union Colony Civic Center.

Parks Water Use: Greeley strives to make parks irrigation financially and environmentally responsible. Parks are on a water budget that is focused on efficiency, rather than a set schedule. Parks use a little less water than they need; the 5-year average of water use is 93% in Greeley's parks.

Get More Information

Please contact Colleen Young at 970-350-9846 with any questions about this report or for public participation opportunities that may affect water quality. To view the report online, visit www.greeleygov.com/water. Access information about drinking water in general on the EPA's drinking water web site as www.epa.gov/safewater.

Additionally, the public is welcome to attend meetings of Greeley’s Water and Sewer Board, which are usually held on the third Wednesday evening of every month at Lincoln Park Annex. Nushbaum Room, located at 919 7th Street. For more information on times, dates and locations of the Board meetings, please contact Yvonne Thornberg at 970-350-9818.

Greeley Drinking Water Sources

Greeley drinking water comes from surface water located in four river basins: Cache la Poudre River, Laramie River, Big Thompson River, and Colorado River. Greeley uses six high-mountain reservoirs in the Poudre basin (Barnes Meadow, Comanche, Houghlass, Peterson, Milton Seaman, and Twin Lake) to retain water from spring snowmelt for redistribution during the summer and fall when water demand is high but river flows are low.

In addition, the city uses a plans reservoir system (Boyd Lake, Lake Loveland and Horsetooth Lake) to provide storage for summer demands. Greeley owns a portion of the Colorado-Big Thompson (C-BT) and Windy Gap Projects. We store our portion from the C-BT Project in Lake Granby, Horsetooth Reservoir and Carter Lake and can deliver water to either the Poudre or Big Thompson basins to meet water demand.

Greeley treats water at the Boyd Lake Water Treatment Plant in Loveland and the Bellvue Water Treatment Plant located north of Fort Collins. Treated water is then piped to Greeley where it is distributed to customers or stored in one of three finished water reservoirs.

A More Informative Water Bill

You have unique water needs and it can be difficult to know if you are efficient with your use. The new Water Budget program provides each customer with personalized water use information on the monthly water bill. The Water Budget is the amount of water each customer uses if they are moderately careful and factors such as lot size and weather are taken into account.

Take time to look at the water use charts on your Greeley water bill. It is a tool for you to save money and water by providing information on water use and encouraging waste.

If you are interested a more detailed approach to your water use, Greeley can provide a hand-held electronic water meter monitors to check real-time water use. Please call (970) 350-9859 to reserve your water monitor. It will be programmed for your home meter and then it will be ready for pickup.

2012 Drinking Water Quality Results

In compliance with the Colorado Primary Drinking Water Regulations, the Greeley Water and Sewer Department is pleased to present our annual Drinking Water Quality Report for the calendar year 2012. Our constant goal is to provide you with a safe and dependable supply of drinking water. Greeley routinely monitors for contaminants in your drinking water according to federal and state laws. The following table shows all detections found in the period from January 1, 2012 to December 31, 2012, unless otherwise noted. The state requires us to monitor for certain contaminants less than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year, or the system is not considered vulnerable to this type of contamination. Therefore, some of our data, though representative, may be more than one year old. Only detected contaminants sampled within the last five years appear in this report. Here is a list of certain contaminants sampled within the last five years:

**Disinfectants Sampled in the Distribution System**

<table>
<thead>
<tr>
<th>Contaminant</th>
<th>Monitoring Period</th>
<th>Results</th>
<th>Samples</th>
<th>TT Requirement</th>
<th>Typical Sources</th>
<th>Violation?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chlorine</td>
<td>8/12</td>
<td>Lowest monthly percentage of samples meeting TT requirement: 93.88%</td>
<td>98</td>
<td>For any two consecutive months, at least 75% of samples per month must be detectable</td>
<td>Water additives used to control microbes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Microorganism Contaminants Sampled in the Distribution System**

<table>
<thead>
<tr>
<th>Contaminant</th>
<th>Monitoring Period</th>
<th>Results</th>
<th>Samples</th>
<th>MCL</th>
<th>MCLG</th>
<th>Typical Sources</th>
<th>Violation?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coliform</td>
<td>8/12</td>
<td>350% false positive samples</td>
<td>98</td>
<td>No more than 5% positive samples per period</td>
<td>Naturally present in the environment</td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

**Lead and Copper Sampled in the Distribution System**

<table>
<thead>
<tr>
<th>Contaminant</th>
<th>Monitoring Period</th>
<th>Results</th>
<th>Samples</th>
<th>TT Requirement</th>
<th>Typical Sources</th>
<th>Violation?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copper</td>
<td>06/01/11 to 09/30/11</td>
<td>0.4 ppm</td>
<td>30</td>
<td>1.3 ppm</td>
<td>Corrosion of household plumbing systems, erosion of natural deposits</td>
<td>No</td>
</tr>
<tr>
<td>Lead</td>
<td>06/01/11 to 09/30/11</td>
<td>0.16 ppm</td>
<td>30</td>
<td>15 ppm</td>
<td></td>
<td>No</td>
</tr>
</tbody>
</table>

**Disinfection By Products Sampled in the Distribution System**

<table>
<thead>
<tr>
<th>Contaminant</th>
<th>Average of Individual Samples</th>
<th>Range of Individual Samples</th>
<th>Samples</th>
<th>MCL</th>
<th>MCLG</th>
<th>Typical Sources</th>
<th>Violation?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chlorite</td>
<td>0.243 ppm</td>
<td>0.6 - 0.32 ppm</td>
<td>26 ppm</td>
<td>1 ppm</td>
<td>0.8 ppm</td>
<td>Reproduction of drinking water</td>
<td>No</td>
</tr>
<tr>
<td>Total Halocarbons (HAAS)</td>
<td>27.6 ppm</td>
<td>14.7 ppm</td>
<td>32 ppm</td>
<td>60 ppm</td>
<td>N/A</td>
<td></td>
<td>No</td>

<tr>
<td>Barium</td>
<td>0.051 ppm</td>
<td>0.018 - 0.864 ppm</td>
<td>2 ppm</td>
<td>2 ppm</td>
<td>Discharge of dripping water; discharge from metal refineries, erosion of natural deposits</td>
<td>No</td>
<td></td>
</tr>
<tr>
<td>Fluoride</td>
<td>0.735 ppm</td>
<td>0.66 - 0.81 ppm</td>
<td>2 ppm</td>
<td>4 ppm</td>
<td></td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

**Terms and Abbreviations**

- **Action Level (AL):** The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.
- **Maximum Contaminant Level (MCL):** The ‘Maximum Allowed’ is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
- **Maximum Contaminant Level Goal (MCLG):** The ‘Goal’ is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

**Important Information**

The following is important information about Greeley drinking water. The Colorado Primary Drinking Water Regulations require Greeley to monitor your drinking water for specific contaminants on a regular basis. Results of regular monitoring are an indicator of whether or not our drinking water meets federal and state health standards.

All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk.

Cryptosporidiosis is a microbial pathogen found in source water in Colorado. It must be ingested to cause disease and may be spread through water, food, and other eating or drinking water. Symptoms of infection include nausea, diarrhea, and abdominal cramps. Most healthy individuals can overcome the disease within a few days. Cryptosporidiosis is eliminated from drinking water by an effective treatment combination utilized by the Greeley Water Department which includes coagulation, sedimentation, filtration, and disinfection.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk for infections. These people should seek advice about drinking water from their health care providers. Contaminants that may be present in source water include:

- **Microbial contaminants,** such as viruses and bacteria that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic contaminants,** such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- **Radionuclides,** that can be naturally occurring or be the result of oil and gas production and mining activities.
- **Organic chemical contaminants,** including synthetic and volatile organic chemicals, which are byproducts of industrial processes, petroleum production, and also may come from gas stations, urban stormwater runoff, and septic systems.

For more information about contaminants and potential health effects, or to receive a copy of the U.S. Environmental Protection Agency and the U.S. Centers for Disease Control guidelines on appropriate means to lessen the risk of infection by cryptosporidiosis and microbiological contaminants call the EPA Safe Drinking Water Hotline 1-800-426-4791.

**Lead in Drinking Water**

If present, elevated levels of lead can cause serious health problems (especially for pregnant women and young children). It is possible that lead levels at your home may be higher than other homes in the community as a result of materials used in your home's plumbing. If you are concerned about lead in your water, you may wish to have your water tested. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. Additional information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline 1-800-426-4791 or at www.epa.gov/safewater/lead.

**Nephelometric Turbidity Unit (NTU):** Nephelometric turbidity unit is a measure of the cloudiness of water and is defined as the amount of light scattering by a suspension of particles in water. One nephelometric turbidity unit (NTU) is just noticeable to the average person.

**Parts per million (ppm):** One part per million corresponds to 1 milligram per liter (mg/l), a very dilute concentration of substance.

**Parts per billion (ppb):** One part per billion corresponds to 1 microgram per liter (µg/l), a very dilute concentration of substance.

**Treatment Technique (TT):** A treatment technique is a required process intended to reduce the level of a contaminant in drinking water.
